

WHAT IS KETAMINE IV THERAPY?

"Intravenous (IV) Ketamine infusion therapy has emerged as a treatment option for a variety of chronic pain conditions including fibromyalgia, small fiber neuropathy, complex regional pain syndrome (CRPS), reflex sympathetic dystrophy (RSD) and psychiatric conditions including depression, post-traumatic stress disorder (PTSD), suicidal ideation, and obsessive-compulsive disorder (OCD)."

Ketamine Infusion Therapy FOR DEPRESSION & CHRONIC PAIN

**AdvantAge Integrative
Medicine**

What does research show about the benefits of Ketamine IV Therapy and Depression?

"Researchers from Yale and the National Institute of Mental Health say Ketamine seems to cause a burst of new connections to form between nerve cells in parts of the brain involved in emotion and mood.

A few years ago, researchers discovered that Ketamine could help people with major depression who hadn't responded to other treatments. What's more, the relief came almost instantly.

The discovery 'represents maybe one of the biggest findings in the field over the last 50 years'.

Possible Risks & Side Effects

Risk is very low though some patients do experience side effects including nausea, mild non-threatening hallucinations, or dizziness.

Maintenance

A series of low dose Ketamine infusions can dramatically alter or even eliminate chronic pain, and provide protection against relapse of depression or suicidal thoughts.

Can Ketamine IV Therapy help me?

Research over the last 5-10 years has shown that intravenous administration of Ketamine in sub-anesthetic doses remarkably benefits people suffering from severe chronic pain, anxiety and depression.

Patient Testimonial

"Having both Post traumatic stress disorder and chronic severe back pain due to 2 unsuccessful back surgeries, I was the perfect candidate for anesthesia using ketamine for my last 3 surgeries. For both the PTSD and chronic back pain, symptoms have been reduced by at least 75%. I could not be happier! Finally and again!"
